First Fundamental Theorem

$$\frac{d}{dx} \int_{a}^{g(x)} f(t) dt = f(g(x)) \cdot g'(x)$$

Second Fundamental Theorem

$$\int_{a}^{b} f(t)dt = F(b) - F(a) \text{ where } F'(x) = f(x)$$

Fundamental Theorem of Calculus:

$$\int_{a}^{b} f(x) dx = F(b) - F(a), \text{ where } F'(x) = f(x), \text{ or } \frac{d}{dx} \int_{a}^{b} f(x) dx = f(x).$$

$$\frac{\mathrm{d}}{\mathrm{d}x}\int\limits_{a}^{x}f(t)\;\mathrm{d}t=f(x)\quad \text{ or } \qquad \frac{\mathrm{d}}{\mathrm{d}x}\int\limits_{\mathbf{h}(x)}^{\mathbf{g}(x)}f(t)\;\mathrm{d}t=\mathbf{g}^{\,\prime}\!\left(x\right)\!f\!\left(\mathbf{g}\!\left(x\right)\!\right)-\mathbf{h}^{\,\prime}\!\left(x\right)\!f\!\left(\mathbf{h}\!\left(x\right)\right)$$

Fundamental Theorem of Calculus:

$$F'(x) = \frac{d}{dx} \int_a^x f(t) dt = f(x) \text{ where } f(t) \text{ is a continuous function on } [a, x].$$

$$\int_a^b f(x) dx = F(b) - F(a), \text{ where } F(x) \text{ is } \underline{\text{any}} \text{ antiderivative of } f(x).$$

$$\int_{a}^{b} f(x) dx = F(b) - F(a)$$
 , where F(x) is any antiderivative of f(x).
