13. A  $f'(x) = \frac{|4-x^2|}{x-2}$ ;  $f$  is decreasing when  $f' < 0$ . Since the numerator is non-negative, this is only when the denominator is negative. Only when  $x < 2$ .
14. C  $f(x) \approx L(x) = 2 + 5(x-3)$ ;  $L(x) = 0$  if  $0 = 5x - 13 \Rightarrow x = 2.6$
15. B Statement B is true because  $\lim_{x \rightarrow a^-} f(x) = 2 = \lim_{x \rightarrow a^+} f(x)$ . Also,  $\lim_{x \rightarrow b} f(x)$  does not exist because the left- and right-sided limits are not equal, so neither (A), (C), nor (D) are true.

85. C Look at the graph of  $f'$  and locate where the  $y$  changes from positive to negative.  $x = 0.91$

86. A  $f(x) = \sqrt{x}$ ;  $f'(x) = \frac{1}{2\sqrt{x}}$ ;  $\frac{1}{2\sqrt{c}} = 2 \cdot \frac{1}{2\sqrt{1}} \Rightarrow c = \frac{1}{4}$

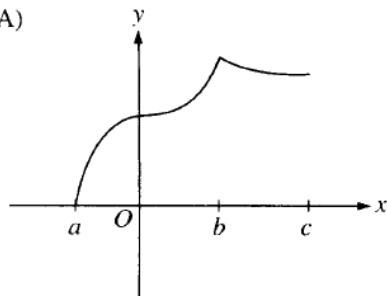

87. B  $a(t) = t + \sin t$  and  $v(0) = -2 \Rightarrow v(t) = \frac{1}{2}t^2 - \cos t - 1$ ;  $v(t) = 0$  at  $t = 1.48$

88. E  $f(x) = \int_a^x h(x)dx \Rightarrow f(a) = 0$ , therefore only (A) or (E) are possible. But  $f'(x) = h(x)$  and therefore  $f$  is differentiable at  $x = b$ . This is true for the graph in option (E) but not in option (A) where there appears to be a corner in the graph at  $x = b$ . Also, Since  $h$  is increasing at first, the graph of  $f$  must start out concave up. This is also true in (E) but not (A).
